

Koliko je zelena Vaša kuća?

Poštivanje ekoloških faktora prigodom gradnje, nekad od sporednog značenja, danas je arhitektima glavna preokupacija. Loše isprojektirane građevine zagađuju okoliš i troše prirodne resurse. U vrijeme velike potrošnje energije i zabrinjavajućeg stanja u prirodi potreba za samoodrživom arhitekturom sve je veća. Još jedno Taschenovo izdanje o arhitekturi ovaj put donosi projekte arhitekata, umjetnika i ureda koji su pioniri u tzv. novoj zelenoj arhitekturi te se bavi tom novom estetikom. Među arhitektima čiji su projekti zelene arhitekture uvršteni u ovo izdanje su, među ostalim, Tadao Ando, Shigeru Ban, Foster + Partners, UNStudio i mnogi drugi.

How Green Is Your House?

Respecting the ecological factors during the construction process is an element that used to take the backseat in the past, but architects now see it as their main preoccupation. Poorly projected buildings pollute the environment and waste natural resources. During this period of large energy consumption and nature's worrying situation, the need for self-maintainable architecture is getting bigger by the minute. Another Taschen edition on architecture this time features projects by architects, artists and offices that served as pioneers in this so-called new green

architecture, as well as analyzes this new aesthetics. The list of architects whose green-architecture projects are chosen for this edition includes Tadao Ando, Shigeru Ban, Foster + Partners, UN Studio and many others.
